

Platforms	Languages	Explanation
Backend	Python	The front end of the Project Placed web application has been coded in Python using Django web framework before the project was assigned to our team. Hence, we continue to develop the backend of the web application using Django, which uses the Python language.
Database	MySQL	Default database management system used by our clients.
API	LinkedIn API	LinkedIn API is used to extract the users' data from their LinkedIn accounts and display it on Project Placed after they allow the web application to access their LinkedIn data.
Front end	N/A	Our team is only in charge of developing the backend of the web application.
Version Control Repository	GitHub/Bitbucket	This is to ease the implementation of our prototype and to keep track of our progress. We have to choose either Github or Bitbucket. Our client requested that the codes to be made private. We chose BitBucket as it allows the repository to be made private without need to pay.
