

Blue Bus - ATOS

Team 6 (ATOS4)

4th March 2016

Ali Aliyev

Yanwen Feng

Recently we did not do much because the first week is busy Scenario Week. Scenario week took all our time and there was no lab session for BlueBus. During the last two weeks, we managed to connect to online hosting system, allow user to select the marked address and return the address back to Search Page and Add page.

In the following weeks we will catch up to work on journey arrangement and journey offering.

Ali Aliyev:

I have managed to connect our app to online hosting service(hostinger.co.uk). It contains databases for user details. I am planning to implement ride details database on that system as well. Implementing online database connection allows continuous and more reliable connection to servers. When a user registers or logs in, his/her details are stored in relevant tables and fetched accordingly. As soon as I am completely finished with log in/register I will start with ride offer&search function.

Yanwen Feng:

In the last two weeks I finished the selecting of address and the data flow between pages. Job about Map Page is done and we need to carry on about the more important functions of offering journeys and arrange journeys. If there are more opinions from our client, we can improve it later. BlueBus now allows user to select the marked offices and it returns the address from Map Page to Search Page and Add Page for later use. User can search for any location with address or postcode, but currently they can only choose to start or finish journey at ATOS offices. And the selected address will be returned.
